Wes Mantooth Investigation

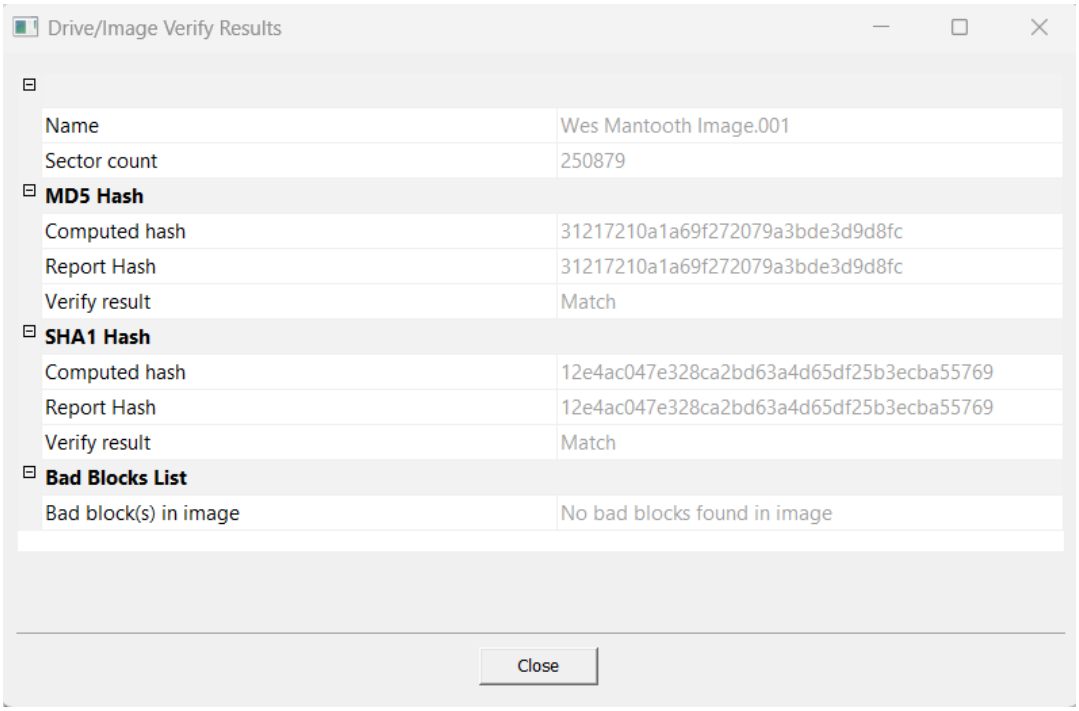
This is a continuation of the John Washer case, and this investigation will be for the suspect Wes Mantooth's laptop. I will search through the laptop's hard drive and analyze the data to find any incriminating evidence against Wes Mantooth.

Imaging of Hard Drive

FTK Imager

I used FTK Imager to take an image of the hard drive so that no original evidence was tampered with. Here is the hash of the image so that it can be compared to the original:



Drive/Image Verify Results

Name	Wes Mantooth Image.001
Sector count	250879
MD5 Hash	
Computed hash	31217210a1a69f272079a3bde3d9d8fc
Report Hash	31217210a1a69f272079a3bde3d9d8fc
Verify result	Match
SHA1 Hash	
Computed hash	12e4ac047e328ca2bd63a4d65df25b3ecba55769
Report Hash	12e4ac047e328ca2bd63a4d65df25b3ecba55769
Verify result	Match

Presentation of Evidence

Forensic Explorer

Forensic Explorer is one software I used to analyze the data within the hard drive. This software handles the registry information well, and is one of the main reasons for using this software.

Axiom

Axiom is another piece of software I used during this investigation, as it categorizes file system information in a user-friendly GUI format, making it easy to find certain data.

Email

Figures 62 – 64 show an email that is intended to scam people out of their money.

Confidential Business Proposal

Having consulted with my colleagues and based on the information gathered from the Nigerian Chambers Of Commerce and Industry, I have the privilege to request your assistance to transfer the sum of $47,500,000.00 (forty seven million, five hundred thousand United States dollars) into your accounts. The above sum resulted from an over-invoiced contract, executed, commissioned and paid for about five years (5) ago by a foreign contractor. This action was however intentional and since then the fund has been in a suspense account at The Central Bank Of Nigeria Apex Bank.

Figure 68

Figures 69 – 78 are email conversations held between Wes Mantooth and multiple others who are involved with drug organization, washing checks, and cracking into ATMs.

Anywaze... We should get together sometime and I can show you my "goods". I am getting pretty good at my trade.

In the meantime, we will keep our new relationship on the QT via Email.

Let me know if I can help you in any way with your ventures.

John

Dude!

You been laying a little low these days?

I have been trying to call you almost daily and we can't hook up!

I have the "Special K" your looking for... but it is going to cost you!

Figure 75

So, what do you say we trade a few blanks for some of the good stuff?

I am going to be in your town next week and we could hook up for the trade.

Don't bother sending me the ones with security. I want the easy stuff.

Deal?

By the way, I have some stereos and blue steel if your interested. We can talk about it then.

Figure 76

Sweet!

If that turns out to be too risky, a budy of mine showed me how to rig the machines to keep the cards... Then we shoulder surf the pin and get the card when they leave!

He got this from a SPAM chainletter!

I love it!

Top 10 Ways to Steal a Car (and how to defend against them)
By Caroline Pardilla
Email | Blog

Lists come out every year detailing the most stolen cars and, with that, what steps one can take to deter car thieves. Yet, a car is stolen in the United States every 24 seconds according to the Insurance Information Institute. Auto theft continues to thrive despite those lists and regardless of new anti-theft technology that emerges with every new model year.

Figure 81– document found of how to steal a car

This is my confession.

I am the scum of the earth. I rob from the rich... and the poor too!

I taketh away... and keepeth!

I did it all... I am guilty

Oh, by the way, I am deleting this so you will never find it!

:)

Figure 89– These are the six encrypted documents found on the device

Conclusion

During the forensic analysis of Wes Mantooth's hard drive, which was obtained through a search warrant, I examined both the device's registry and file system. Initial findings in the registry revealed strong evidence linking the device to Mantooth. Specifically, the system registry file identified the computer as "WESMANTOOTH-PC." The SAM file contained a primary user account under his name, and the Software file showed that the registered owner was Wes Mantooth, with the registered organization listed as Volturi Enterprises. This information establishes a clear connection between Mantooth and the data found on the device.

Upon examining the file system, I focused on the media files stored on the disk, which showed a series of concerning images and documents. The initial images included various checks, both blank and filled out under random names. Further investigation uncovered Google searches related to "check washing," a fraudulent technique that involves using chemicals to erase check details and rewrite them for a higher payout. An email from John Washer to Wes Mantooth inquired about removing ink from checks using their "usual method," suggesting a history of such illegal activity. The combination of these images, searches, and messages indicates a likely scheme involving Mantooth and Washer engaging in check washing for personal gain.

Additional disturbing images depicted a hidden camera setup at an ATM designed to capture credit card and PIN information. The camera, discreetly placed in a pamphlet holder, was positioned to capture both the keypad and computer interface of the ATM. Supporting emails between Mantooth and Washer outlined methods to modify ATMs to retain cards and use the captured PINs to withdraw funds illegally. Another conversation indicated that a third party, David Thomas, sought assistance with breaking into an ATM at his house.

The analysis also uncovered numerous images and documents related to drug manufacturing and trafficking. These included searches for methamphetamine recipes, drug labs, and methods for

creating illegal substances. Corresponding emails between Mantooth and his contacts discussed the delivery of drugs, obtaining specific substances, and trading goods for narcotics. A detailed drug list in Mantooth's text documents outlined clients, orders, and payment amounts, providing substantial evidence of his involvement in drug distribution.

The investigation further revealed images of vehicle titles not registered under Mantooth's name. While initially unclear, a subsequent search for "how to steal cars" suggested that Mantooth might have been attempting to fraudulently transfer vehicle ownership to himself. Considering the broader context of criminal behavior, this possibility aligns with his other illegal activities.

A particularly incriminating piece of evidence was a written confession found on the device. In this document, Mantooth admitted to stealing from both the rich and poor, explicitly stating, "I did it all... I am guilty." He expressed confidence that the document would never be discovered since he intended to delete it. Ironically, it was recovered during the forensic examination.

Lastly, six encrypted documents were found, though attempts to decrypt them were unsuccessful. Mantooth had left a clue in a text document suggesting a password, "supercallifragilistic," but it did not match any of the encrypted files. Searches for encryption tools and the presence of uninstalled encryption software in the registry suggest deliberate efforts to hide additional evidence.

In conclusion, the forensic analysis of Wes Mantooth's hard drive presents overwhelming evidence of his involvement in criminal activities, including check washing, ATM skimming, drug trafficking, and potential vehicle theft. The undeniable link between Mantooth and the device, combined with incriminating images, emails, and a written confession, strongly support the case against him. The encrypted files, while not yet accessible, likely contain further evidence of wrongdoing. Ultimately, this investigation highlights Mantooth's role as a significant threat to public safety and financial security.

Appendix of Terms

FTK Imager: A forensic tool used for imaging hard drives and creating bit-by-bit copies to preserve original data. It ensures the integrity of the evidence by generating a hash value for comparison with the original data.

Forensic Explorer: A software used in forensic investigations to analyze digital evidence, specifically handling the registry files and providing insights into system activities and configurations.

Axiom: A digital forensics tool used to organize and categorize data from hard drives in a user-friendly graphical user interface (GUI). It aids investigators in locating and interpreting critical information.

Registry: A hierarchical database in Windows operating systems that stores low-level settings for the operating system and for applications that opt to use the registry. It plays a vital role in identifying user profiles and system configurations.

SAM (Security Accounts Manager): A database that stores user account information and encrypted passwords in Windows. This file is key to identifying users on a device.

SAM Local Users: Refers to the users stored in the SAM file, typically indicating local accounts on a system that do not rely on a network server.

System: The system file within the registry contains configuration details of the operating system. It holds essential information about hardware, devices, and system services.

Time Zone: The system's time zone setting, which may offer insights into the geographical region or activities of the device's user.

Computer Name: The unique identifier for a computer within a network, often used for identifying devices remotely.

Software: A file in the registry containing details about installed software, including names, versions, and the registered owner.

Uninstalled Programs: Programs that were previously installed but have been removed. Investigating this can provide insight into what software the suspect may have used or interacted with.

Registered Owner/Organization: The name and organization associated with a device, typically entered during the installation of the operating system or software.

Product Name and ID: Information stored in the system that identifies the product or operating system, including license numbers or identifiers that may be used for validation or piracy checks.

Disk Structure: Refers to the way data is organized on the hard drive, including partitioning and file system formatting.

Size of Partition: The amount of space allocated to a specific partition on the hard drive. This can help in understanding data allocation and usage.

Format: The file system used on a partition, such as NTFS or Ext2, which determines how data is stored, retrieved, and managed.

Active File Review: Refers to the process of reviewing files that are actively in use or modified, often focusing on recently accessed or altered files.

Web Related: Websites and online activities, including searches and visited pages, that may provide context to criminal behavior or suspicious activity.

Media: Images, videos, and other multimedia files that could serve as evidence in an investigation.

Documents: Refers to text-based files, such as word processing documents, PDFs, and spreadsheets, that might contain incriminating evidence or important records.

Encryption: The process of encoding data to prevent unauthorized access. Encrypted files may indicate attempts to hide illegal activities or evidence.

Check Washing: A form of fraud where the original details on a check are chemically removed to alter the payee and amount, allowing for unauthorized cashing of checks.

ATM Skimming: The illegal practice of using devices to capture and store data from ATM users' credit cards and PINs for later use in fraudulent activities.

Drug Trafficking: The distribution or trade of illegal drugs. Evidence of drug trafficking may include communication, transactions, or manufacturing methods.

Meth Labs: Illegal laboratories where methamphetamine is produced. These are often documented through images or searches relating to the manufacturing process.

Encryption Tools: Software designed to encrypt or decrypt files. The presence of these tools can suggest attempts to conceal evidence or activities.

Vehicle Title Fraud: The act of altering or falsifying vehicle ownership documents, often linked to criminal activity such as theft or resale of stolen vehicles.

Check Fraud: Criminal activities involving the alteration, forgery, or manipulation of checks for financial gain.

Criminal Conspiracy: A coordinated effort among individuals to engage in illegal activities. In this case, emails and other communications suggest collaboration between Mantooth and others to commit various crimes.

Decryption: The process of converting encrypted data back into a readable format, often used during investigations to access hidden or secured files.

Digital Forensics: The application of investigative techniques to digital data in order to uncover evidence related to criminal activity, including data retrieval, analysis, and preservation.

Hash: A digital fingerprint or unique identifier of data, used in forensic investigations to verify the integrity of digital evidence.

Bit-by-Bit Copy: A method of copying data from a storage device that ensures every bit of data is transferred, preserving the original data exactly as it was.

Registry Files: Files within the Windows registry that store critical system and application data, often crucial in forensic analysis to determine usage patterns or system configurations.
